(Stack) Yigit Veri Yapısı: Sadece tek yönden hareketi Olan diziye (stack) yigit denir.

Ornek Program: (Struct) Veri Yapısını belirleyelim:

define SIZE 4

Uigit struct stock {
Veri float items [SIZE];
int top;];

Test Fonksiyonu!

bool 19 Empty (struct stock *s)

{ if (s > top = = -1) > sayıcı, -1 ise true defilse false

return true; Sonderir.

Syntax: Push:++ 5→ top

x: 5->ltems[s->top]

s -> \tem s [-- S -> top]

```
else
return false;
       Yigit iqinden Eleman qıkaran Fonksiyon: (POP)
     float Pop (struct stock *s)
        If (! Is Empty (s))
           double x = 3 > Items [s -> fop];
            (-- (gotes)
             return x :
      // return soltems[sotop] « deneme !
          else
         il" u/ ipamolidok wasti, taq tilih, jtuild &
           return 0;
          3
     Z
     Yigit iqine Elemon ekleyen Fonksiyon;
         Void Push ( struct stack *s, Louble *)
              If (3->+op < SIZE-1)
             ¿++(90+€a) }
                   3 -> item [ 5-> top] = x3
                else
              3 printf ("yigit dolu- \n");
           3
Ekma yazdıralım (Pek akıllaca olmayan Honten)
```

```
void Print Steek ( struct stack *s)
     while (! Is Empty (s))
     print f (" x.O.1 f", popls)

noktaden sonra tel besonrale
yazdir.
HNA PROGRAM
 int main ()
   double di > siliner elemon atayacagim defizien
Struct Stack y; > yight ver yapes)

push (8y, 1): > 1 exile

push (8y, 2.779); > 2.779 exile
   d=pop(8y); > LIFO 194 sôre Sil.
    printf ( "yigittan feliler ekman
                                 = x.2.1f\n ", 2);
   d = pop(8y);
   return Oj
```
